EXTERNAL:

Please take into account the scientific findings of OEHHA when it comes to the cap of 1-3D. This fumigant is the third highest use in California and many people will get and die of CANCER. The communities with highest drift of this fumigant are communities of poor people and this is Environmental Injustice.

0.04 ppm is the safer amount and there is no way we (Fresno County) need to be exposed to 14 times higher levels of this fumigant. My friend that is an agronomist has explained to me that the same outcome can be reached using alternative materials that are safer to the humans working and living around these infected fields. It is heart breaking that children work across the street from some of these Almond Orchards are being exposed to cancer even before birth.

Quoted by EPA director that it's time DPR and DOW do their part in keeping families and children safe.
